ALLAN, J. R. L., 1970. The sequence of sedimentary structures in turbidites,
with special reference to dunes
Scott. J. Geol., 6 (2), 146-161

The relationship between bed form, grain-size of load, and flow power known from equilibrium-state, open-channel experiments, is revised for turbidity currents, whose power is time-dependent with respect to a point in their path. The revised relationship suggests that cross-bedding, indicative of dune beds would occur in turbidite sandstones only if the parent turbidity currents had been furnished with sufficiently coarse-grained sediment. Otherwise, the turbidite sandstones are expected to show parallel laminations directly succeeded upward by cross-lamination. The available field evidence is consistent with these conclusions, and some previous difficulties regarding dune structures in turbidites appear now to be resolved.

ALLAN, W. C. 1970. The Morven-Cabrach basic intrusion
Scott. J. Geol., 6 (1), 53-72

The rocks of the southern half of the Morven-Cabrach mass consist mainly of norites, with two northerly dipping layers of ore- and olivine-rich ferrogabbro. In the north there is a progression of rocks from hypersthene-gabbro through quartz- biotite-norite to xenolithic quartz-mica-diorite. All the rocks are relatively iron-rich, and no highly magnesian types are found. Mineral compositions are remarkably constant, and chemical variation is slight. The mass has been intruded in its present position and is a (relatively) narrow steep-sided, dyke-like body.

A tentative hypothesis, based largely on the dimensions of the mass and the high temperatures of the country rocks, is put forward for the lack of cryptic variation. The relationships between the Morven-Cabrach mass and the postulated north-east basic sheet are considered, and a feeder-pipe role suggested for Morven-Cabrach.

Funérailles de M. Duméril.- Allocution
prononcée par le Dr. Laboulbène.

s.l.éd., (1860).

2 p., 22x14,5cm.

(dans Ann.Soc.Ent.Fr., Ser.III, VIII,
1860).

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice to ensure transparency and accountability.

2. The second section outlines the various methods used for data collection and analysis. It highlights the need for consistent data entry and the use of standardized formats to facilitate comparison and trend analysis over time.

3. The third part of the document addresses the challenges of data management, particularly in large-scale operations. It suggests implementing robust security protocols and regular backups to protect sensitive information from loss or unauthorized access.

4. Finally, the document concludes by stressing the role of technology in modern data management. It encourages the adoption of cloud-based solutions and advanced analytics tools to streamline processes and gain deeper insights from the data.

ALVES, C. A. Matos X
MAGEDO, J. Rocha

Petrography of the Munhino region (caracul area, district of Moçâmedes) — 2. Rocks of the granitic complexe.

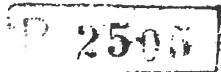

Garcia de Orta (Lisboa) vol. 13 (n.º 2): 259-266, 1965

Petrographic study of the granitoid rocks of the district of Moçâmedes (Angola) in relation with a previous survey of the granites of the same area (*Petrography of the Munhino region (sheet No. 334 of the Map of Angola) — 1. Granites*). The rocks forming the petrographic unit called «granitic complexe» by the Authors of the geological survey seem to constitute a continuous petrographic series, from the alkaline granites to the now described quartz diorites. All inter-

P2505

mediate types of the monzonic granites and granodiorites have been recognized.

The most significant phenomena stressed are the tectonization and the symptoms of the essentially potassic metasomatism of the whole series. Concerning the latter phenomenon, it was possible to observe myrmekytes and banded plagioclases, by reacting the latter with potash feldspar (microcline), particularly among the calc-alkaline granites.

Garcia de Orta (Lisboa) vol. 12 (n.º 2) : 261-268, 1964

Estudam-se os alcalóides presentes numa amostra de tubérculos de *Dioscorea dumetorum* Pax colhida na Guiné.

O resíduo que constitui os alcalóides totais da planta, depois de convenientemente purificado, foi submetido a ensaios de cromatografia em camada delgada e em papel, obtendo-se sempre uma única mancha, após revelação dos cromatogramas, cujo *R_f* é igual ao da dioscorina e di-hidrodioscorina.

O exame espectral desse resíduo e das fracções dele obtidas por cromatografia em coluna mostra que na planta existe uma mistura dos dois alcalóides, a qual deve conter, aproximadamente, 26 % de dioscorina.

Do extracto éter de petróleo foi isolado um composto que dá positiva a reacção de Liebermann, o qual foi cristalizado e identificado como sendo o β -sitosterol. Do mesmo extracto isolou-se ainda um pigmento amarelo, que se comporta como um carotenóide hipofásico, cujas características espectrais em vários solventes se descrevem. Além disso, verificou-se ainda a ausência de saponinas.
