Contribution to the study of «Phyllites Feldspatiques» of Maiombe and Higher Congo (Angola).

*Garcia de Orta* (Lisboa) vol. 12 (n.º 3) : 515-526, 1964

In the Federal Republic of Congo the rocks designated as «Phyllites Feldspathiques», included in the Maiombe System formations, occur in narrow bands from the Chiloango River to south of the Matadi-Léopoldville railroad and continue in Angola in Cabinda and Higher Congo. They are acid lava, ancient and of rhyolitic nature.

*Garcia de Orta* (Lisboa) vol. 12 (n.º 3) : 515-526, 1964

Na República Federal do Congo as rochas designadas por «Phylites Feldspathiques» incluídas entre as formações do Sistema do Maiombe, ocorrem em estreitas faixas desde o rio Chiloango até ao sul do caminho de ferro de Matadi a Léopoldville, continuando em Angola em Cabinda e Alto Congo. São lavas ácidas, antigas e de natureza riolítica.

La courbe  $\int kdT$  de combustibles constitués de poudres compactées  
d' $UO_2$  et d' $UO_2 - PuO_2$  a été mesurée hors pile en fonction de la  
température.

L'influence des gaz de remplissage hélium, argon et azote sur la

valeur  $\int k dT$  a été mesurée et la théorie de Deissler et Eian a été utilisée afin d'évaluer les attributions de la conductivité thermique du matériau céramique et du gaz aux valeurs totales mesurées de la conductivité thermique.

Les influences de la densité et de la présence du  $\text{PuO}_2$  sur la valeur  $\int k dT$  ont été évaluées.

Les valeurs mesurées  $\int_0^{\tau_f} k dT$  sont :

$$\left[ \int_0^{\tau_f} k dT \right]_{88 \pm 1 \% DT} = 63 \pm 7 \text{ W/cm}$$

$$\left[ \int_0^{\tau_f} k dT \right]_{84 \pm 1 \% DT} = 70 \pm 8 \text{ W/cm}$$

Andrzej Dutkowski and Aleksandra Przełęcka: Cellular response in the female gonads of *Galleria mellonella* L. (*Lepidoptera*) to experimental disturbances in the normal supply of hormones. *Zoologica Poloniae* 19 (1969), 151-196.

Depriving prepupae and pupae of the hormone supply results in pathological changes in their gonads, marked by disturbances in RNA distribution, enlargement of nucleoli, vacuolization of trophocyte and oocyte cytoplasm and hypertrophy of the follicle and epithelial sheet cells. The gonadotropic effect of experimental re-introduction of hormones depends on the developmental stage of the specimen.

Andrzej Dutkowski: The development of female gonads  
in pupae of *Galleria mellonella* L. (*Lepidoptera*).  
*Zoologica Poloniae* 19 (1969), 115-132

In this paper the development of female gonads of *Galleria mellonella* L. during prepupal and pupal stage is presented. In the studies has been taken into consideration the morphology of egg chambers as well as the localization and sites of nucleic acids and lipids synthesis in this cells.

The possible participation of one of the insect hormone ecdysone — in the control of nucleic acid synthesis in the developing egg chambers is discussed.

—85.

The cases of larvae of the common caddis fly *Limnephilus flavicornis* (Fabr.) are often made of the shells of molluscs. The aim of the present work was to establish how far the molluscs collected by the larvae of this caddis fly represent the molluscan fauna of some waters. On the basis of investigations of two old river beds it was established that

The density of European hare population on the hunting grounds of Polish Hunting Union Research Station in Czempiń was estimated by regression function of the number of hares caught in subsequent drives. The estimation was based on the catch from 20 sampling areas, the total of 2,361 hectares. The realized production of young from one female was determined and the mortality of foundation stock was estimated from retrapping of marked hares. From these data the optimal yearly take of hares from this population was calculated. Large fluctuations of realized production of young and inaccurate information on the foundation stock mortality make precise foreseeing of these values difficult and consequently, it is necessary to plan the take very carefully in order to maintain the population numbers in autumn on the desired level. Nevertheless, the proposed method together with the studies of realized young production allow correcting the plan of catching for the actual population numbers at the very beginning of cat[redacted]ason.

Points of catch of small rodents of different number of traps (1—7) were  
spaced in a shape of a network on the are area of several hectares. Simple  
proportion between the number of captures in a point and the number of traps  
set in it has been found with a slight trend towards decrease of trapability in  
points of a larger number of traps.
