THE ICE BUDGET OF THE ARCTIC PACK AND
ITS APPLICATION TO ICE FORECASTING, by
Edward L. Corton, September 1954. 13p., 2 tables.
(H. O. TR-6).

Contains a discussion of the annual cycle of the
polar pack, as well as a statistical presentation of
the amount of melting, amount of new ice formation,
and the average age of the remaining polar ice under
various assumptions.

Luanda (Angola) and its
surroundings.

Garcia de Orta (Lisboa) vol. 12 (n.º 4): 691-706, 1964

The observation of the heavy minerals of the superficial sands of Luanda and its outskirts reveals the following: the overimposed gravels and red sands present marine morphometric and morphoscopical characteristics; between the epochs during which the two formations have accumulated there must have been a semi-arid period evidenced by the patina of the palaeolithic remains discovered; later, during the regressive phase of the sea, erosion ravinated the red sands, setting sandy layers that enveloped non-patinaed palaeolithic remains, which leads to admit the absence of an insolation period and the possible presence of a protective vegetable covering, nonexistent today and where there exists a marked erosion process.
