- DAWES, P. R.: The North Greenland fold belt and environs. *Bull. geol. Soc. Denmark*, vol. 20, pp. 197-239. Copenhagen, January, 6th, 1971.

P5848

A review of our present knowledge of the North Greenland fold belt and environs is presented.

Precambrian crystalline basement, which is exposed at places adjacent to the Inland Ice and can be expected to form larger areas now covered by its northern extremity, is overlain with marked angular unconformity by a Proterozoic to Lower Palaeozoic sedimentary pile. These sediments dip gently northwards forming a platform and hinterland to the North Greenland fold belt which occupies the extreme northern part of Greenland as a roughly E-W zone of deformation and metamorphism. In Peary Land, where the widest part of the zone occurs, the effects of deformation and metamorphism increase northwards towards the assumed centre of the orogenic belt. In eastern Peary Land, the folded Lower Palaeozoic sediments are unconformably overlain by strata of Pennsylvanian Permian, Triassic and Cretaceous-Tertiary age. This sequence has been affected by Tertiary earth move-

P. 5. 848

of both shelly and graptolitic faunas in the folded sediments indicating the presence of Cambrian, Ordovician and Silurian strata in the folded zone; 5) indications that the sediments of the folded zone have passed through a long and complex orogenic history, suffering poly-phase deformation and metamorphism—the earlier interpretation of the folded zone as being characterised by intensive superficial thrusting and by nappes and overthrusts of alpine dimensions is refuted; 6) the first isotopic age determinations from the folded zone which suggest a Laramidian thermal episode of regional importance producing Abu-kuma-type mineral assemblages subsequent to the Palaeozoic metamorphism, and also indicate important Tertiary tectonism; 7) the rediscovery in the folded zone of a bedded volcanic sequence of lavas and tuffs (Kap Washington Group), the effusion of which post-dates the main Palaeozoic diastrophism of the surrounding metasediments but pre-dates Tertiary earth movements.

An extensive bibliography of the main works dealing with the bedrock geology of North Greenland includes the paper.

UN METODO PER LA SELEZIONE DEI "TESTS"  
di W. DE AMBROGIO (Università L. Bocconi)

Comunità Europea dell'Energia Atomica — EURATOM  
Relazione elaborata dall'Università L. Bocconi, Milano (Italia)  
Contratto Euratom No 015-61-5 CETI  
Bruxelles, Giugno 1964 — 30 pagine

La decisione sulla convenienza o meno di effettuare un certo test richiede il confronto fra il costo che esso comporta e l'informazione che esso fornisce.

In questo lavoro l'analisi dei fattori principali viene utilizzata come punto di partenza per la determinazione della quantità di informazioni fornite da ciascun test.

Per far ciò

- 1) Si eliminano i fattori che risultano essere non significativi;
- 2) Si procede iterativamente alla stima delle communalità;

DEARNLEY, R., 1967. Metamorphism of minor intrusions associated with the  
Newer Granites of the Western Highlands of Scotland  
*Scott. J. Geol.*, 3 (3), 449-457

A late Caledonian phase of regional metamorphism is outlined in the Western Highlands. Minor intrusions associated with the Newer Granites are found to exhibit varying degrees of regional metamorphism in which the zonal 'isograds' trend about north-east-south-west, approximately parallel to and increasing in grade towards the Great Glen. There is a major break in the zoning along the line of the Great Glen Fault.

STANDARD PILES by P. de BEAUCOURT, J. BOYER, H. DENIS, C. HYVER and  
A. PRODOSCIMI

Association : European Atomic Energy Community - EURATOM  
Commissariat à l'Énergie Atomique - CEA

Work performed at the Centre d'Études Nucléaires de Grenoble, France

Association No. 006-62-1 RAAF

Reprinted from "Bulletin d'Informations Scientifiques et Techniques du CEA-BIST"

N° 81 - mars 1964, pp. 1-6.

This article gives a survey on "standard pile" with the description of the main problem, the power construction, neutron sources, moderators and shieldings.

Flux measurements :

calibration by activation of gold-197 with absolute determination by means of coincidence ( $\beta \gamma$ ) ;

flux calculation by means of Fermi  are considered. Brief descriptions of standard piles belonging to the C.E.A.  also given.

**TENSILE TESTS AT LOW TEMPERATURES ON SAP 4 %**  
by D. BOERMAN and R. DEBEIR

European Atomic Energy Community — EURATOM  
ORGEL Program

Joint Nuclear Research Center

Ispra Establishment (Italy)

Materials Department — Metallurgy and Ceramics Service  
Brussels, February 1966 — 14 Pages — 9 Figures — FB 40

This study deals with the application of a new cryostat, working with a gaseous phase, in order to execute tensile tests between room temperature and  $-196^{\circ}\text{C}$ .

As material SAP 4 % was chosen.

At the same time a new correction method was used so that the elastic modulus was obtained without using an extensometer.

P 5353

EUR 2710.f

UN CRYOSTAT EN PHASE GAZEUSE par R. DEBEIR et M. GRIN

Communauté Européenne de l'Energie Atomique - EURATOM  
Programme ORGEL

Centre Commun de Recherche Nucléaire - Etablissement d'Ispra (Italie)  
Métallurgie et Céramique  
Bruxelles, février 1966 - 12 pages - 7 figures - FB 25

Les auteurs décrivent un cryostat fonctionnant en phase gazeuse : le fluide thermostatique est de l'azote qui est vaporisé dans la chambre de mesure. L'appareil, caractérisé par une grande souplesse d'emploi, peut être utilisé à toute température, de l'ambiante à la température de l'azote liquide ( $-196^{\circ}\text{C}$ ) et adapté à diverses mesures physiques (résistivité, traction à basse température).

SOME EXPERIMENTAL RESULTS ON THE SORPTION OF CAESIUM BY TUNGSTEN AND GRAPHITE by G.F. DE BENI, O. GAUTSCH and H. WAHL

Commission of the European Communities

Joint Nuclear Research Centre - Ispra Establishment (Italy)

Physical Chemistry

Luxembourg, November 1970 - 22 Pages - 7 Figures - B. Fr. 40.—

A submicron W-powder, a nuclear graphite and a pyrolytic graphite sample were loaded with Cs at sample temperatures between 600 and 800°C and Cs-vapour pressures from about 0.01 to 30 mm Hg to see whether such systems could be used as Cs-reservoirs in thermionic converters. The amounts of Cs sorbed by the samples at a given temperature as a function of time, were measured by a radioactive tracer method using Cs<sup>134</sup>. From these sorption curves the saturation loadings and the corresponding equilibrium pressures of the Cs-vapour were determined.

The Cs saturation loadings on the W-powder ranged at different temperature and pressure conditions, from 1.0 to 4 mgCs/gW. The sorbed Cs was strongly
