Cah. ORSTOM, sér. Ent. méd., vol. VIII, n° 1, pp. 95-105, 2 fig., bibliogr. (6 réf.).

S. gracilipes Edw. est une espèce dont un seul exemplaire ♀, constituant l'holotype déposé au British Museum, était connu jusqu'ici. L'ornementation très curieuse du thorax, s'ajoutant à certains caractères morphologiques, ont amené les auteurs à admettre que cette Simulie ne peut entrer dans aucun des sous-genres actuellement créés pour le genre *Simulium*, tel qu'il a été redéfini par CROSSKEY (1963). La découverte des stades pré-imaginaux et l'obtention d'imagos ♂ et ♀, permettent de considérer l'espèce comme le type du sous-genre : *Crosskeyellum* nov. s. g., qui paraît être, dans l'état actuel de nos connaissances, monospécifique.

***Simulium (Xenosimulium) neireti* Roubaud, 1905 (Diptera, Simuliidae) : description des stades préimaginaux et du mâle ; description complémentaire de la femelle.**

Cah. ORSTOM, sér. Ent. méd., vol. VIII, n° 2, pp. 123-129, 2 fig., bibliogr. (5 réf.).

Les auteurs donnent la première description des stades préimaginaux et du mâle de *S. neireti*, espèce très agressive pour l'homme et le bétail à Madagascar. Par sa nymphe à 19 filaments et la morphologie de ses genitalia ♂ et sa larve, l'espèce est très proche de *S. ambositrae* Grenier et Grjebine et *S. griveaudi* M. et L. Ovazza, 1970. Elle diffère de celles-ci à l'état nymphal par la disposition des branchies cuticulaires, le cocon, et, à l'état imaginal, par la forme de la plaque ventrale des genitalia ♂, les denticulations mandibulaires chez la femelle, la coloration des pattes et la taille des magos, qui sont nettement plus petits que ceux de *S. ambositrae*.

Cañ. ORSTOM, sér. Ent. méd., vol. VIII, n° 4, pp. 377-382, 1 carte, bibliogr. (10 réf.).

Une enquête dans le nord de la Tunisie a permis aux auteurs de récolter 8 espèces paléarctiques de Simulies : *S. mediterraneum* Puri, 1925 ; *S. nitidifrons* Edwards, 1920 ; *S. latinum* Rubzov, 1962 ; *S. (? latipes)* Meigen, 1804 ; *S. cryophilum* Rubzov, 1959 ; *S. sp.* ; *S. (? yerburyi)* Edwards, 1920 ; *S. (? erythrocephalum)* De Geer, 1776.

Les deux dernières appartiennent à des groupes d'espèces ou à des sous-genres signalés pour la première fois d'Afrique du Nord.

GRIBBLE, C. D., 1967. The basic intrusive rocks of Caledonian age of the Haddo House and Arnage districts, Aberdeenshire
Scott. J. Geol., 3 (1), 125-136

Basic igneous rocks of the Haddo House and Arnage districts consist of olivine-norites, and quartz-norites which include uralitised and xenolithic types.

No layered sequence is observed in the basic igneous rocks of Haddo House and Arnage, and their petrochemistry suggests that some water must have entered the magma in that area producing hypersthene- and quartz-normative rock types. This would account for the differences observed between the igneous rocks of Haddo and Arnage and those in other parts of north-east Scotland which were intruded at the same time, and might be products of the same parental magma.
