C.C.R. ISPRA — CARATTERISTICHE DEL SITO

Comunità Europea dell'Energia Atomica — EURATOM
Centro Comune di Ricerca Nucleare — Stabilimento di Ispra (Italia)
Servizio Protezione
Bruxelles, aprile 1967 - 64 pagine - 14 figure - FB 85

Sono descritte le principali caratteristiche della zona in cui si trova lo Stabilimento di Ispra del C.C.R. Euratom interessanti da un punto di vista meteorologico, idrologico, demografico ed ecologico. Le informazioni contenute provengono in parte da documenti già disponibili presso il C.C.R. Euratom Ispra, in parte dall'Ufficio Provinciale di Statistica di Varese, in parte sono state raccolte direttamente dalla Sezione Sito e Meteorologia del Servizio Protezione.

M. V. Ivanov and G. I. Karavaiko: The role of microorganisms in the sulphur cycle in crater lakes of the Golovnin caldera.
Ztsch. f. Allg. Mikrobiol. 6, 10—22 (1966)

There are complexes of specific hydrochemical conditions in the water of the crater lakes of the Golovnin caldera which are not observed in common hydrosulfuric water reservoirs. The low pH level of the water (2.8—3.0) is the most important feature. The total amount of bacteria in the lake water is close to that of common fresh water reservoirs, however, the flora is very specific qualitatively: Saprophytic bacteria, sulphur bacteria and *Th. thioparus* are practically almost absent while *Th. thiooxidans* is widely spread with numbers in the Goryachyee lake amounting to 100 thousand cells per ml. Sulphate reducing bacteria are found in water and silts of the lakes. The main portion of hydrogen sulphide comes into the lake from submarine fumaroles; its oxidation to sulphur takes place without the participation of microorganisms. The final stage of sulphur cycle, the oxidation of elementary sulphur to sulphates, is connected with the activity of *Th. thiooxidans*.

M. B. IVANOVA: Relations between the food concentration, filtration rate and effectiveness of oxygen utilization by Cladocera. *Pol. Arch. Hydrobiol.*, 17 (1970), 161-168.

The interrelation of the regression used hitherto (filtration rate on food concentration) and the efficiency of O_2 utilization was discussed. At low food concentrations the filtration rate is sufficiently high to permit the Cladocera to satisfy their demand for energy, the oxygen utilization efficiency being then extremely low. At high food concentrations the filtration rate attains the minimum but remains sufficiently high to satisfy the demand for oxygen, the efficiency of oxygen utilization being then at its physiologically possible maximum for the given species. The respective empirical formulae connecting the above parameters are given and discussed.
