**INTRODUCTION TO THE STUDY OF THE PHYSICO-CHEMICAL BEHAVIOUR OF RADIORUTHENIUM CONTAINED IN RADIOACTIVE WASTE** by R. AMAVIS (C.C.E.) and J.M. BLUM, J.J. JAUMIER and J.L. VEROT (Ugine Kuhlmann)

Commission of the European Communities  
Report prepared by the Directorate-General for Social Affairs,  
Directorate for Health and Safety, Environmental Health and Control  
of Radioactivity, Luxembourg and  
the Ets Ugine Kuhlmann, Paris (France)  
Euratom Contract No. 030.66-11 PSTF  
Luxembourg, June 1970 — 46 Pages — 8 Figures — FB 70,—

A great deal of radioactive pollution of the environment is at present due to radoruthenium. Lack of information on the physico-chemical behaviour of this element makes it difficult to eliminate during purification treatment of radioactive waste.

Krzysztof Jażdżewski: **Biology of *Crustacea Malacostraca* in the Bay of Puck, Polish Baltic Sea.** *Zoologica Poloniae* 20 (1970), 423-480.

The author discusses the biology of 26 species of *Crustacea Malacostraca* inhabiting the Bay of Puck (Baltic Sea, Gulf of Gdańsk).

Life cycles are illustrated by the successive histograms and tables which show the composition of the population of particular species in various months. The changes in the relative number of females with brood pouches, the changes in the proportion of juveniles in the population and the changes in sex ratio are presented. The data on the fecundity (Tab. 15) and on the size (Tab. 16) of investigated species are given. In Fig. 21 the length of the breeding periods of species and their zoogeographical qualification on the background of several years, monthly average temperature curve are juxtaposed.

Der Bau des *Helodeablattes* ist sehr einfach. Es besteht mit Ausnahme des Mittelnervs nur aus zwei Schichten von kistenförmigen Zellen.

Die Initialzellen der Blattanlagen treten auf dem Vegetationskegel als horizontale erhabene Wülste hervor. Ein Längsschnitt durch den Vegetationskegel zeigt, dass ein solcher Wulst aus zwei Zellreihen besteht, die sich je zu der oberen und unteren Zellschicht des Blattes entwickeln.

Die Initialzellen entstehen aus den Epidermiszellen durch Änderung der Wachstumsrichtung der Zellwände und zwar in folgender Weise:

Biol. Medd. Dan. Vid. Selsk. **23**, no. 8. 1–51. Mit 10 Figuren. With an English Summary. København 1958.

Wenn Epikotyle von *Phaseolus* in horizontaler Zwangslage untergebracht werden, nimmt der Wuchsstoffgehalt an der Oberseite ab. Gleichzeitig wird die Wachstumsgeschwindigkeit vermindert, und die Zellwände in der Rinde der Oberseite werden verdickt. Die Entstehung der Verdickungen kann durch Wuchsstoffzufuhr verhindert werden und entstandene Verdickungen können durch Wuchsstoffzufuhr zum Verschwinden gebracht werden.

Es wird geschlossen, dass die wachstumsregulierende Wirkung des Wuchsstoffes in dem *Phaseolusepikotyl* dadurch zustande kommt, dass mit abnehmender Wuchsstoffkonzentration eine Umschaltung von schnellem Längenwachstum mit der Bildung dünner Zellwände zu langsamem Längenwachstum mit der Bildung dickerer Zellwände stattfindet. Bei zunehmender Wuchsstoffkonzentration geschieht die Umschaltung in entgegengesetzter Richtung.
