Brüssel, September 1968 — 70 Seiten — 22 Abbildungen FB 85

Die Entwicklung eines Verfahrens wird beschrieben, mit dem radioaktive flüssige Abfälle nach dem Gefriertrockenverfahren behandelt werden. Ziel der Entwicklung ist ein trockenes lagerfähiges Konzentrat und ein flüssiger oder gasförmiger Rückstand mit einem Dekontaminationsfaktor von mindestens 10^5 .

Das Gesamtverfahren, das die Schritte Verdampfen, Einfrieren und Gefriertrocknen umfaßt, wird in einer Versuchsanlage mit einem Durchsatz von etwa

SEPARATION AND MEASUREMENT OF CESIUM-137 IN PRECIPITATION

In rainwater samples containing fallout debris of recent origin, the ^{137}Cs absorption peak in a γ -ray scintillation spectrum contained, and was often completely obscured by, contributions from other γ -ray emitting radionuclides, so that the ^{137}Cs activity could not be determined directly. Precipitation samples were collected with rain funnels and passed through Dowex 50W-X12 cation-exchange columns. The ^{137}Cs was selectively eluted with 0.5 *M* ammonium nitrate. The absolute recovery of ^{137}Cs was complicated by the presence of airborne sediments that were invariably collected with the sample and could irreversibly fix ^{137}Cs from the rainwater.

JOHNSON, M. R. W. and A. L. HARRIS, 1965. Is the Tay Nappe post-Arenig?
Scot. J. Geol., 1 (2), 217-219

Structural investigations suggest that rocks of supposed Arenig age exposed in the River North Eask have been deformed by movements which gave rise to the earliest folds in adjacent Dalradian rocks. The earliest folds in these Dalradian rocks can probably be correlated with the F₁ nappe folds described from elsewhere in the Central Highlands. It is likely, therefore, that the formation of the Tay Nappe post-dated the deposition of the 'Arenig' rocks of the Highland Border. Since the fossil evidence from the Highland Border 'Arenig' rocks has been shown to be unreliable, the importance of determining their radiometric age is stressed.

P 4363

JOHNSON, M. R. W. and HARRIS, A. L., 1967. Dalradian-?Arenig relations in parts of the Highland Border, Scotland, and their significance in the chronology of the Caledonian orogeny.

Scott. J. Geol., 3 (1), 1-16

P 4 363

Comparisons of structures in the Jasper and Green Rocks (J.G.R.) (?Arenig) and Dalradian exposed in the River North Esk, near Edzell, lead to the following correlations which are presented in conjunction with the possibly equivalent events in the Central Highland regional history.

NORTH ESK		<i>Central Highlands Regional History</i>
<i>J. and G. Rocks</i>	<i>Dalradian</i>	
Near-isoclinal folds, with flow cleavage	Near-isoclinal folds, with flow cleavage Growth of biotite porphyroblasts	F ₁ (Tay Nappe, Aberfoyle anticline) Climax of regional metamorphism
Tight folds with axial planar strain-slip cleavage	Tight folds with axial planar strain-slip cleavage	F ₃ (Ben Ledi antiform, [‘downbend’], Cowal antiform)
Two sets of corrugations and kink bands	Two sets of open folds and crenulations	F ₄ etc.

These correlations are supported by evidence that the ?Arenig in Arran is downward facing.

JOHNSON, M. R. W. and J. SHEPHERD, 1970. Notes on the age of metamorphism
of the Moinian

Scott. J. Geol., 6 (2), 228-230

A post-Cambrian age for the main metamorphism of the Moinian is supported by recent work in the Carn Chuinneag-Assynt region. The earliest structures in the Moinian ante-date the 530 m.y. old Carn Chuinneag granite and can only be assigned to the *post-Cambrian* orogenesis of a minimum age of 530 ± 10 m.y. is assumed for the Cambro-Ordovician boundary.
