Jolanta Hempel: **Some remarks on chemical composition of egg-coverings and cuticle in *Triops cancriformis* (Bosc) and *Lepidurus productus* (Bosc).** Zoologica Poloniae 15 (1965), 143-146.

The outer egg-shells of *Triops cancriformis* (Bosc) contain a brown hemoglobin-type pigment, the egg-shells of *Lepidurus productus* (Bosc) are colourless. In both species the inner egg-membranes are built of chitin; in the outer coverings the presence of chitin has not been stated. The average contents of chitin in the cuticle of *Triops cancriformis* (Bosc) and *Lepidurus productus* (Bosc) amounted to 25.7% and 32.9%, respectively.

The paper gives a revised list of the flowering plants of Greenland with cyt-taxonomical comments. The authors have counted the chromosome numbers of 237 species from different parts of Greenland. These numbers, together with those already known, are presented in a complete list comprising 437 species of flowering plants. 51 species in which apomictic reproduction is proved or assumed, are listed. 46 sexual species show "intraspecific polyploidy". The chromosome number is known for 91 per cent of the species and 65 per cent have been counted on Greenland material. 86 per cent of the monocotyledons are polyploids, against 62 per cent of the dicotyledons.

The ultrastructure of the valves of five recent species of ostracods is investigated. These are *Cypredeis* sp., *Bythocypris* sp., *Xestoleberis* sp., *Cythereis* sp. and *Trachyleberis dunelmensis* (Normann, 1865).

In order to determine the orientation of the crystalline matter the valves were studied in polarized light and in an X-ray diffractometer. The results indicate that the crystals are extremely well orientated with the optical axes perpendicular to the shell surface.

All the sections studied in the transmission electron microscope show that the ostracod valve is built of small crystal units enclosed by organic membranes. The diameter of the crystal units generally is about 2μ . The crystal units generally show no preferred morphological orientation.

Besides the calcite the ostracod valve consists of organic matter in form of a matrix. Organic sheets form a part of the matrix and lie parallel or subparallel to the valve surface. The sheets do not
